Google Cloud

Welcome to module 3: Access, explore, and report on data in the cloud

Welcome to this section of the program, all about accessing, exploring, and reporting on data in the cloud! We'll be focusing on the last two stages of the data journey: analyze and activate.

- You're going to explore some really amazing data visualization tools and discover how to select the right tool for each phase of the data analytics workflow. You'll also learn how to access, explore, and analyze cloud data that's stored in data lakes, data warehouses, and other sources.
- Along the way, you'll explore datasets using data visualization tools. Then, you'll learn about data types, dimensions, and measures to better understand the data model. You'll also use data modeling to customize how data appears.
- Next, you'll model data for visualizations, which includes modifying, blending, and aggregating the data. You'll also learn how to manipulate and organize data in a way that best yields insights.
- Finally, you'll understand report analysis for visualizing and sharing information with stakeholders. You'll also get direct experience with Data Studio, where you'll connect to a data source, explore a dataset, transform fetched data, and create a report.

Now that you have a roadmap for what's coming up, let's get started!
